

Enable Kollektive On an Entry

 This article is designated for all users.

About

The article describes how to enable Kollektive on an entry.

For the admin guide, see [Enable and Configure Kollektivestreaming Module](#).

Introduction

Once the Kollektive module is installed, enabled, and configured, a new tab displays (called Kollektive) when viewing an entry's "edit" page. The Kollektive tab allows users to publish the entry to Kollektive and displays a specific token (called a contentToken) once an entry has been successfully published to Kollektive.

Enable Kollektive on an Entry

1. Login to MediaSpace using your Kaltura user ID and password. See instructions, on how to [Login to MediaSpace](#).

The home page displays.

Check out Kaltura MediaSpace's new theming!

2. Navigate to [My Media](#) and locate an entry you wish to edit.
3. Click the **Pencil icon** to Edit your Entry. For additional instructions, see [Manage Media - Edit Entries](#)
4. Click on the **Kollektive** tab.

The user interface displayed depends on how your KMS Admin configured the Kollectivestreaming Module.

Option A -

If your KMS Admin set **publishToKollectiveByDefault** to **No** in the Kollectivestreaming Module, the following window displays.

Option B -

If your KMS Admin set **publishToKollectiveByDefault** to **Yes** in the Kollectivestreaming Module, the following window displays.

This means that the entry was automatically published to Kollective upon creation. In other words, the entry obtained a Content Token as soon as it was created, therefore you do not have the option to publish the entry to Kollective.

 End users consume the entry as normal, using the Kaltura Player with all its features and functionality. The fact that it is delivered using the Kollective eCDN solution is completely transparent to the user.
