

Can you host videos at your preferred location and link to Kaltura?

This use case is typically combined with transcoding performed on the publisher's side, after which the output files are pushed directly to CDN hosting, or to a local intranet delivery source. In this case, Kaltura essentially only manages the metadata while media files themselves are delivered directly from the publisher through a CDN to the viewer. Linking between the files and a Kaltura entry can be done through the KMC, API, or drop folder xml ingestion. See [Kaltura Drop Folders Service For Content Ingestion](#)
