

Categories CSV - Usage and Schema Description

Last Modified on 01/26/2025 11:23 pm IST

This article is designated for administrators.

About

The Categories CSV is handy for creating, updating, or deleting numerous categories at once. It's useful for tasks like:

- Setting up multiple categories for Video Portal (MediaSpace) galleries and channels.
- Regularly syncing Kaltura categories with an external structure, like Video Portal group channels with organization-managed groups.
- Automatically syncing Kaltura categories with an external CMS taxonomy.

For an efficient, on-going CSV based sync process, only new categories and categories that require updating or deletion should be included within the CSV.

Content entitlement related attributes can be populated via the CSV only in accounts that are set to support entitlements and for categories under a category tree branch that is set to have entitlement settings.

General guidelines

- Lines that begin with a # character will not be processed.
- The first line for processing (fields' definition line) should start with an * sign and should include the field names to be populated via the CSV, according to the defined schema of each CSV format. Mandatory fields must be present. The field order may be set as needed.
- Each line for processing within the CSV should include a comma separated list of values ordered by the field ordering set in the fields' definition line.
- Each line for processing within the CSV will apply an action on a single Kaltura object. For example: each line in the categories CSV will apply the action to a single category.
- The CSV may be submitted from the KMC (through the Upload menu) or via a script, by utilizing Kaltura's API.

- Prior to processing the CSV file, its format is validated. When a mandatory field is missing, the bulk job will fail and processing will not start.
- Bulk job tracking as well as downloading bulk job related files (the original CSV and log files) are done through the KMC using the Bulk Upload Log feature under the Upload Control page.
- Email notifications on the completion of bulk upload processing including completion status and a direct link to the log file, can be configured by Kaltura per request.
- There is no limitation on the supported number of lines within each CSV. The overall processing time of each CSV file is affected by the number of lines included in it.
- The following special characters can be populated within text fields via the CSV file:

See special exceptions within each schema description.

Schema description

Parameter name	Mandatory/ Optional	Description	Default	Турє
action		Kaltura's numeric value for the action to apply on a specific category. CSV lines with different actions can be combined into a single CSV file. Only fields that are relevant to the CSV action will be used. The supported action types and their numeric values are: 1=Add - to add a category 2=Update - to update an existing category	1= Add	KalturaBulk

Parameter name	Mandatory, Optional	3=Delete - to delete an existing category	Default	Турє
		6=Add or Update - to add or update a category when the given categoryld or referenceld are already available in Kaltura.		
name	Mandatory in add actions	The name of the category. When the category name includes the > character it will automatically be replaced with _ (underscore character).		Text field. I characters
relativePath	Optional	The category-tree path in which the category is located or should be created. Each category level within the path should be separated by the '> 'character. Note: The provided path must exist prior to		Text field. I
		processing the CSV line, or created in a higher CSV line.		
categoryId	Optional	The Kaltura internal and unique identifier of the category. The categoryld field is used in the CSV for identifying a category that requires updating or needs to be deleted.		Integer
		In an 'update' or a 'delete' action, either the		

Parameter name	Mandatory, Optional	referer Rescription ust be provided for identifying the category to which the	Default	Туре
		action should apply. In 'add' actions the categoryld field will be ignored.		
referenceId	Optional	A possible identifier of the category based on an identifier from an external system that can relate the category to an external entity it represents or related to. In an 'update' or a 'delete' action, either the categoryld or the referenceld field must be provided for identifying the category to which the action should apply. In 'add' actions the referenceld will be populated into the new category. Note: The uniqueness of the referenceld field is not verified nor managed in Kaltura. It is recommended to use logic that maintains this uniqueness for being able to reference bulk actions and API calls to a specific		Text field. I characters
		In case multiple categories with the same		

Parameter name	Mandatory/ Optional	referenceld exist in the accourtes from update/delete action will be committed only to a single category.	Default	Турє
tags	Optional	The tags to be added to the category. Multiple tags can be separated by commas, while the entire field should be wrapped with double quotation marks (e.g. "tag1, tag2). When the CSV is created in a simple text editor or by a script, the wrapping quotation marks should be added explicitly. When CSV is created with a spread sheet editor (e.g. Excel) this wrapping is automatically generated when saving to a CSV format with no need for manual editing. Tag values cannot include commas.		Text field. I
description	Optional	A description of the category and its applicative/administrative purpose. When the CSV is created in a simple text editor or by a script – adding wrapping quotation marks is recommended for cases in which the description includes commas		Text field. I

Parameter name Custom Data	Mandatory/ Optional	Description Custom data fields that	Default	Тур
	Optional	are set to extend the		
		Kaltura Category object		
		can be populated into a		
		category by defining the		
		fields in the following		
		formats:		
		metadata::the-schema-		
		system-name::the-		
		schema-field-name		
		With this format multiple		
		custom data schemas		
		and fields can be		
		populated via the CSV.		
		Custom data schema and		
		fields system names are		
		available in the custom		
		data setting page in the		
		KMC.		
		Values of custom data		
		fields that have multiple		
		values should be		
		separated with the		
		following delimiter: ,		
		Note: When updating		
		custom data fields to an		
		existing category, a new		
		metadata XML is		
		automatically created.		
		For preventing overriding		
		existing values, all		
		custom data fields that		
		are set for the user		
		should be provided in the		
		CSV as part of the update		
		action.		
entitlaments setting		<u> </u>

Parameter name	Mandatory/added Designipstiegory.	Default	Туре
	Optional		
1	<u> </u>		Þ

Examples

Bulk creation of categories - basic metadata only

Updating existing categories with a few entitlement settings

This example uses the referenceld as the category identifier.
