

What time zones are used for scheduling events in the Kaltura Platform

Scheduling the time zone through API or Drop Folders

1. The API always uses the Unix timestamp.

Note that Unix time is indicated in UTC.

2. Bulk upload uses GMT with the format: YYYY-MM-DDThh:mm:ss (T is just the letter T)
 3. The KMC translates the timestamps to the time zone of the client's computer (for example: GMT-5).
