

Download Media

Media owners in KMS and KAF applications can now configure downloadable versions of the media for viewers to download from the media page..

For the User - Viewer

If Media Download was enabled on the specific entry the viewers are watching, they can use the download button and then choose from available flavors list to download the specific file.

The media file will be downloaded to the desktop for future use.

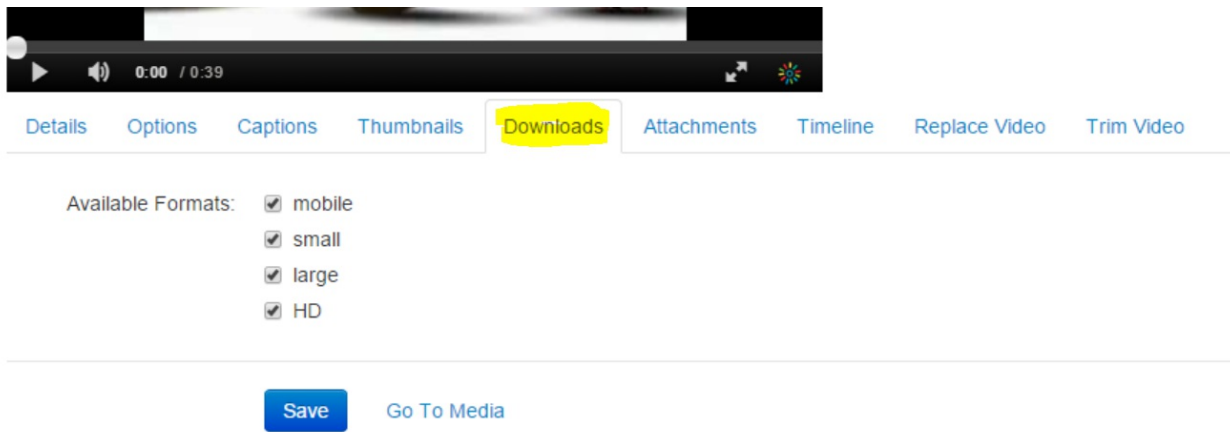

The screenshot shows a video player interface for a video titled "My Test Video" by Anton Zaytsev, posted 3 months ago. The video player shows a progress bar at 0:00 / 0:39. Below the player, there are buttons for "Details", "Download", "Share", "Like", and "Actions". The "Download" button is highlighted in yellow. Below the buttons is a table with columns "Name", "Size", and "Actions".

Name	Size	Actions
mobile	(1.50 Mb)	Download
small	(1.49 Mb)	Download

Below the table is a "Comments" section with an "Add a Comment" input field. At the bottom of the page, a download notification bar is visible, showing a file named "My Test Video (SD-...mp4)" with a download icon and a close button. This bar is also highlighted in yellow.

For the User - Media Owner

Media owners may choose from download tab inside edit entry screen, to check available entries from the list to be visible to the viewers.

For the Admin

The admin can configure this feature under *downloadmedia* module. Other required configurations in that screen are the roles that will be set for viewing the download button and download action (viewer side).

Downloadmedia

enabled

Yes ▼

Enable the Downloadmedia module.

downloadRoles

- Owner Only
- anonymousRole
- viewerRole
- privateOnlyRole
- adminRole
- unmoderatedAdminRole

Select one or more roles that can use the Downloadmedia module.

In addition, the admin will have to configure the flavors that will be visible for the media owner to choose from. The admin may choose as many flavors as they want from the list of the transcoding profiles, as they appear in the KMC. You can then name them as they will appear to the media owner (if no name will be given, the flavor default name in Kaltura will be given by default). Note that the final list which will appear for the media owner will be from what was chosen by the admin from the list and what is actually set (in the KMC) for this KMS instance and available flavors on the specific entry. It is advised that you verify with KMC admin what is checked for the account beforehand.

downloadFlavors

1 **DELETE**

flavorId

SD/Small - WEB/MBL ▼

Select a flavor which will be available to be downloaded via the native app.

name

mobile

Enter the label for the flavor.

2 **DELETE**

flavorId

Basic/Small - WEB/ME ▼

Select a flavor which will be available to be downloaded via the native app.

name

small

Enter the label for the flavor.
