# Monitor Lecture Capture resources and recordings

Content updated: 08/20/2019

## About

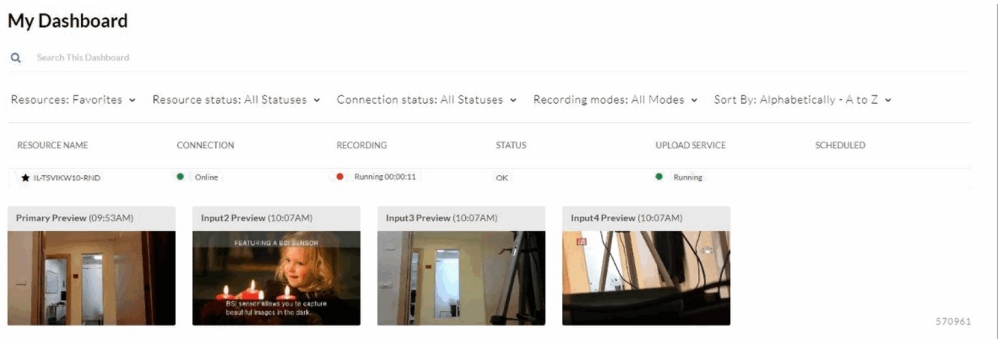

This article explains how to monitor Lecture Capture resources and recordings.

## Monitor the live stream from the dashboard

You can monitor the live stream from the Lecture Capture monitoring dashboard. See My dashboard below.

## My dashboard

The monitoring dashboard lets admins view the status of their campus-wide Lecture Capture installation.

The monitoring dashboard lists all resources, with an expand option for each one.

The dashboard includes:

- **Resource Name**: Each installation has a resource name, also used for scheduling recordings when scheduling is enabled. For more information, see Configure a Lecture Capture resource name.
- **Online/Offline**: When a resource isn't connected to the internet, it appears as offline, along with the last time it was seen online. A resource must be online to report status for monitoring.
- **Recording/Idle**: When a resource is recording, it appears as Recording, with a timer showing how long it's been recording. During a scheduled recording, the timer shows the remaining recording time.
- **Live**: When a resource is live broadcasting in addition to recording, it appears as Live, with a link to the live entry page. The live indicator is red while broadcasting.
- **Status**: Shows whether there are errors or notifications, or whether the status is

OK. If an error occurs, it appears with a timestamp. The error status shows resources deleted in the past three months; earlier deletions don't appear.

- **Upload Service**: Shows the status of the service that uploads recording files to Kaltura. If the status is offline, it shows a timestamp of the last time the service reported itself online.
- **Next Scheduled Event**: Shows the next scheduled event for this resource. This column appears only when the scheduling module is enabled and the user has permission to schedule events.

For more information about a specific resource, click the row to expand the view. It shows:

- A recent snapshot of each input.
- The resource ID.
- The on-air status (live entries only).
- The number of live viewers (live entries only).
