Kaltura Capture Administrator's Guide

> 👤 **This article is designated for administrators.**

Kaltura Capture offers different installation options that Admins can choose from depending on their organization use cases such as:

- Allow end users to download the desktop recorder
- Organization wide installation using a software management solution - See Deploying Kaltura Capture for your Organization.

Installing Kaltura Capture

To get started you will need to enable the Kaltura Capture module in your Kaltura MediaSpace or KAF admin. See Enabling Kaltura Capture for more information.

Make sure you comply with the prerequisites and system requirements - see Kaltura Capture - Prerequisites and System Requirements.

After the module is enabled your users will be able to download Kaltura Capture, install the application and start recording - see Installing Kaltura Capture to learn how to download and install Kaltura Capture on your laptop.

Settings

Kaltura Capture can be configured according to your requirements. Kaltura Capture Settings include the list of configurable settings you can edit according to your use case. These settings can be edited through the config files during installation. User settings are also available in the application. For more information see Kaltura Capture Settings.

Upgrades

Kaltura Capture auto-upgrades to the latest version when the app is running and idle. If you deployed Kaltura Capture through SCCM, you will need to upgrade manually.

Troubleshooting

If you would like to view the logs or the local recording, you can see a directory of the files and folders created with the application, and learn where to find the logs and local recordings.

See Kaltura Capture Folder Directory for more information.
