

Managed deployment of the Capture application

Last Modified on 08/31/2025 8:08 pm IDT

 This article is designated for administrators.

About

IT admins can deploy Kaltura Capture across multiple machines using tools like SCCM. You can install the app silently, customize its settings, and include it in system images.

Key deployment options

For full command-line options, see the official Microsoft reference for [msiexec parameters](#).

Available Kaltura-specific MSI properties

Property	Description
KALTURA_RECORDINGS_DIR	(Optional) Sets the location where Kaltura Capture stores recordings. If not set, a default location is used. If you choose to set this, ensure the folder has read/write permissions for all users.
KALTURA_LOGS_DIR	(Optional) Sets the location of the application's log files. If not set, a default location is used.
KALTURA_URL	(Do not change) This is the endpoint used by the application. Kaltura recommends keeping the default value.
INSTALLDESKTOPSHORTCUT	Set to <input type="checkbox"/> 1 to install a desktop shortcut (default), or <input type="checkbox"/> 0 to skip it.
INSTALLPROGRAMSSHORTCUT	Set to <input type="checkbox"/> 1 to create a Start Menu shortcut (default), or <input type="checkbox"/> 0 to skip it.

Example commands

All commands must be run as an administrator.

Standard install with interface and log:

```
msiexec /i KalturaCapture_admin_0.0.1.msi /L*V "example.log"
```

Silent install with log (no UI):

```
msiexec /i KalturaCapture_admin_0.0.1.msi /L*V "example.log" /qn
```

Silent install with custom recordings folder:

```
msiexec /i KalturaCapture_admin_0.0.1.msi /L*V "example.log" /qn KALTURA_RECORDINGS_DIR="Z:\lectures\"
```

The examples above use msiexec with a sample filename (KalturaCapture_admin_0.0.1.msi). **MSI** (Microsoft Installer) is a standard Windows installation protocol, not a Kaltura-specific installer. Your organization can choose to deploy it this way, or you may use another installation method.
