

How to change the course ID in our Rich Media CMS to be the course name

Last Modified on 05/06/2026 8:40 pm IDT

Usually, the KAF configuration uses the "ltiContextIdAttribute" LTI attribute to create the Rich Media CMS channel and uses the 'context_id' value in order to name the channel in the Rich Media CMS. KAF utilizes three different LTI attributes in order to pass certain information between systems - "context_title", "context_label", and "context_id". As can be seen from the names, each attribute represents a different piece of information related to the course (title, label, and ID). For more information, see [Understanding the Kaltura Application Framework \(KAF\)](#).

1. Go to your KAF admin page
2. Navigate to the Hosted module.
3. Change "ltiContextIdAttribute" from context_id into context_title.
4. Click Save.

Changing this attribute will make the Course Galleries empty since it will create a new Rich Media CMS channel with the new course name. In order to resolve this, you may add the newly created channel as a category for all videos that have the old channel name for the same course.

1. Log into your Rich Media CMS
2. Go to Content > Entries
3. Use the Filter Categories and filter by a course name - Select Moodle Root Category > site > channels > select a course (check only one course name) > now all entries of the Course Gallery should appear.
4. Check all entries
5. Click on Bulk Actions > Add/Remove Categories > Add to Categories > Select the path to the ID-based course channel.
6. Apply
