

Backup and Restore KMS Data

Last Modified on 05/12/2023 3:18 pm IDT

 This article is designated for administrators.

With backups, you can create a secure 'snapshot' of the current site configuration (all modules) as a 'Last Known Good Configuration' to protect against any mistakes or data corruption. This snapshot can later be used in case you need to restore a configuration. We recommend setting the backup snapshot after you have completed the initial setup.

Create a configuration backup

1. In the Admin window, go to **Server Tools** and select **Backup Configuration**.

Server Tools

Backup Configuration 

Player replacement tool

2. Click **Save Backup**.

Backup Configuration

Server Tools

Backup Configuration

Player replacement tool

Global

Application

Create a snapshot of the current site configuration (all modules) as a 'Last Good Configuration'. This snapshot can be later used in case a configuration restore is needed.
We recommend setting the backup snapshot once the initial setup is completed.

Save Backup

Restore Last Saved Configuration

Last configuration save date: 2023-04-10 12:50:40 GMT

 The **last configuration save date** shows the last time a change was made to the configuration, and NOT the last time the user saved the backup. As an example, if you made a change to the configuration on 2023-04-02 at 14:04 and waited 2 minutes before clicking **Save Backup** at 14:06, you would see that the **Last configuration save date** is 2023-04-02 at 14:04 (the time when you made the change and saved it).

Restore a configuration

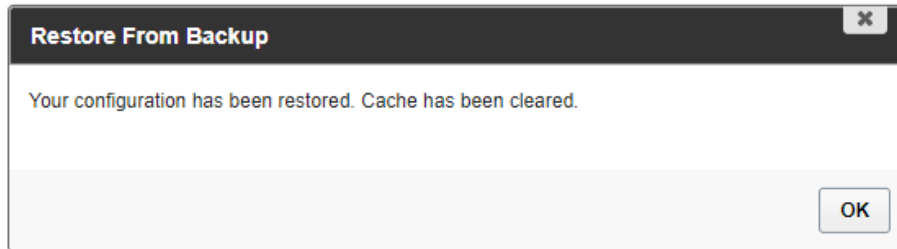

You can easily revert to a previous version of your site configuration by using the restore feature.

1. In the Admin window, go to **Server Tools** and select **Backup Configuration**.
2. Click **Restore Last Saved Configuration**.

A warning message displays.

3. Click **Yes, Restore** or **Cancel**.
4. A confirmation message displays.

5. Click **OK**.
