Follow these steps to use Kaltura API to find entries based on custom metadata.

1. Go to the API console at **https://developer.kaltura.com/console/** (Sign In) **or http://www.kaltura.com/api_v3/testme.**

2. **Generate a KS** (relevant when Testme Console is used)
   See How to Start a Kaltura Session using the TestMe Console .

3. **Session Service:**
   baseEntry

4. **action:**
   list

5. **filter:objectType:**
   KalturaMediaEntryFilter

6. **filter:advancedSearch:objectType:**
   KalturaMetadataSearchItem

7. **filter:advancedSearch:type:**
   2

8. **filter:advancedSearch:metadataProfileId:**
   [schema_profile_id]   (Place here your ID number for example 21664102)

9. **filter:advancedSearch:items:item0:objectType:**
   KalturaSearchCondition

10. **filter:advancedSearch:items:item0:field:**
    /*[local-name()='metadata']/*[local-name()='Field_Label']
     (Place here your field label for example /*[local-name()='metadata']/*[local-name()='MediaSource'])

11. **filter:advancedSearch:items:item0:value:**
    [custom_metadata_field_value]   (Place here your field value for example Keshet 12 News)

12. **Send**

Kaltura API session (string):
