

# Share and embed playlists

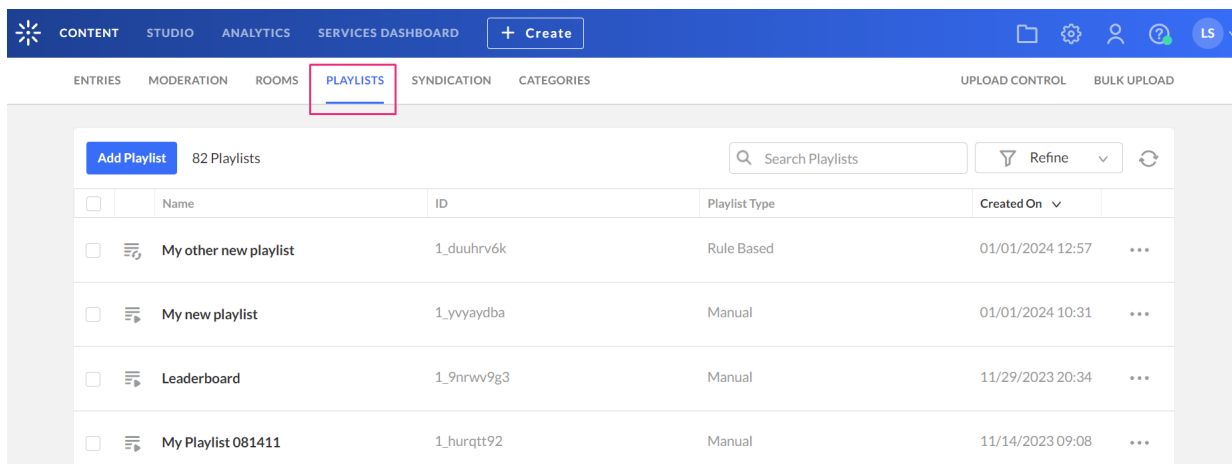

Last Modified on 01/01/2024 2:33 pm IST

 This article is designated for administrators.

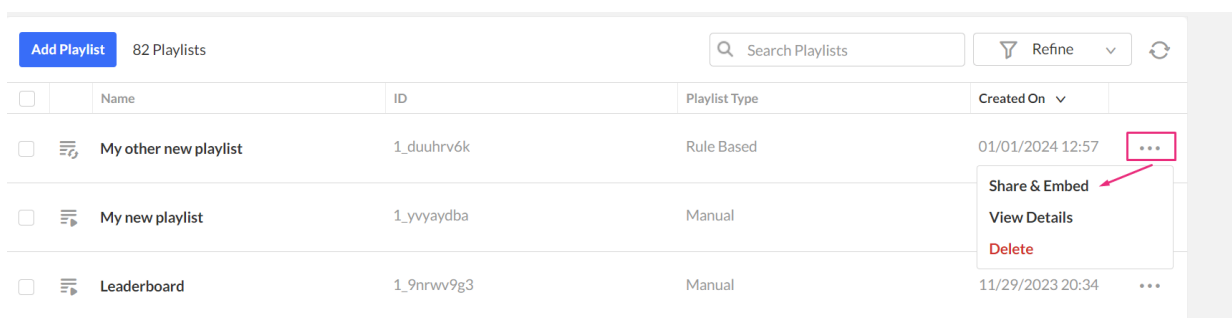

Embedding puts playlists right on your site, so users stay put without being sent elsewhere. Use our simple embed code for responsive, mobile-friendly videos in no time. This guide covers the basics of embedding playlists on your site.

## Access the Share & Embed page

1. Log into your Kaltura Management Console.
2. Under the **Content** menu, click the **Playlists** tab.

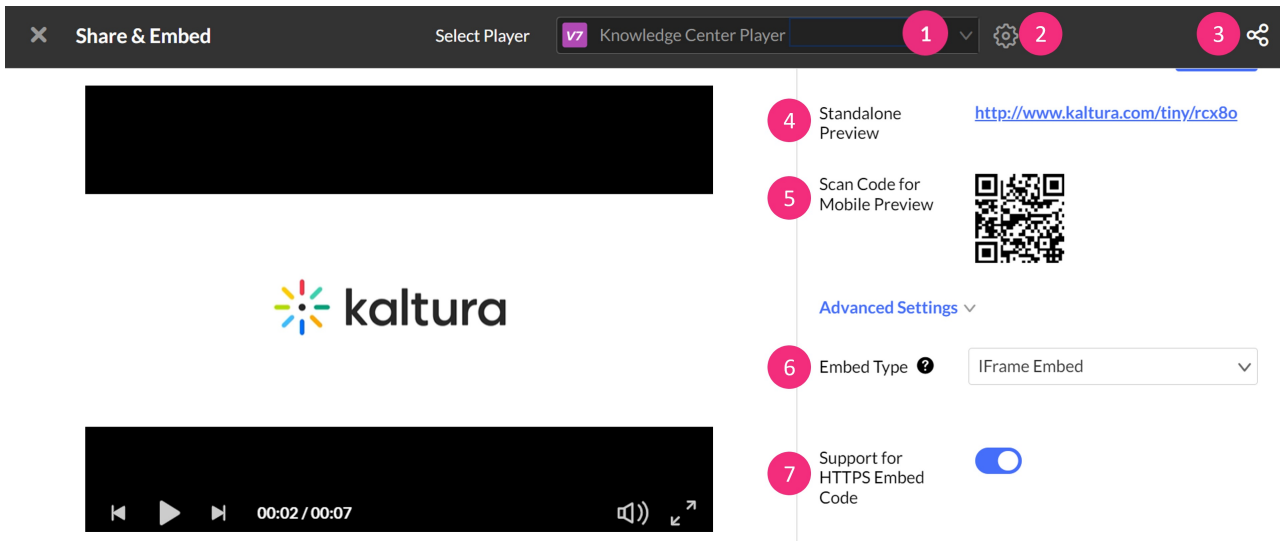

3. Navigate to the playlist you want to share and embed and click the **3 dots menu** to the right of the playlist.
4. Click **Share & Embed**.

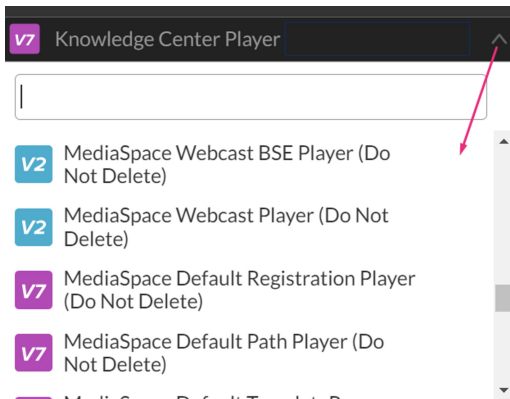

The **Share & Embed** page displays.

## Share & Embed page

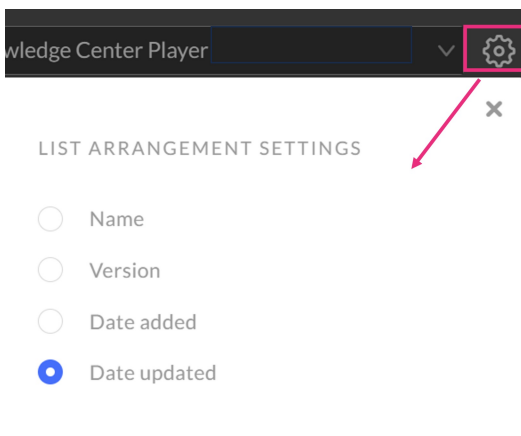

## Preview playlist and select player

Select your preferred player from the **player drop-down menu (1)**. A search is also available when you open the players drop-down list. To learn more about players, visit our article [The Kaltura Player Studio - Getting Started](#).

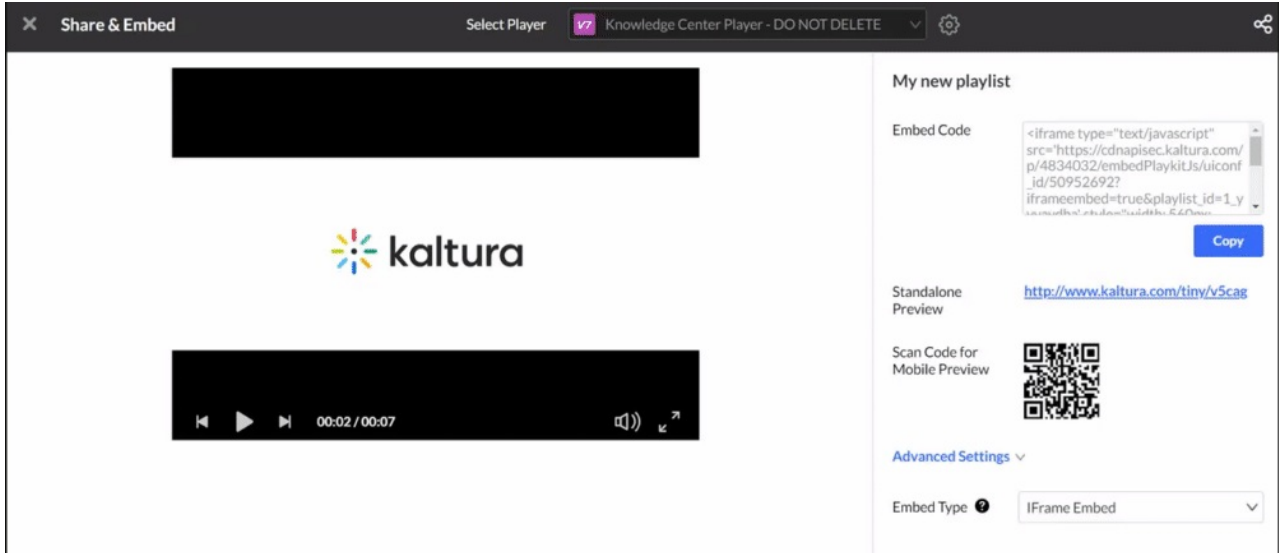

If you'd like to define the order in which the players are listed, click the **settings icon**  to open the menu (2).

**Expand / hide icon (3)** - (Optional) Click to reveal or hide the Embed code options.

**Standalone Preview (4)** - (Optional) Click to view a standalone page with this player by clicking on the provided link.

**Scan Code for Mobile Preview (5)** - (Optional) Scan the QR code to preview the content in your mobile device.

 The QR code and standalone links are for preview use only. Do not use these links for production purposes.

## Advanced Settings

The embed code, short link and QR code are regenerated for each change in the advanced settings. The changes are saved and reloaded for further use.

## Embed types

Select the **Embed Type (6)** from the drop-down menu.

Embed Type 

IFrame Embed	^
Dynamic Embed	
<b>IFrame Embed</b>	✓
Auto Embed	

Support for HTTPS Embed Code

The following options are available:

- **Dynamic Embed** – This is the preferred method to dynamically embed the Kaltura player into web sites and web applications.

- **Iframe Embed** (default) - iframe embed (no page JavaScript) is good for sites that do not allow 3rd party JavaScript to be embedded on their pages. This mode fits more stringent page security requirements while supporting and HTML5 delivery.
- **Auto Embed** – Auto embed is concise embed code and is good for quickly getting a player or widget onto the page without any run time customization.

**Support for HTTPS embed code (7)** - (Optional) Toggle on if you intend to put the player on pages that are delivered over HTTPS. The HTTPS embed URLs use protocol relative URLs so that the same embed code also works for non-secure delivery.

Support for  
HTTPS Embed  
Code

 Logic for defining the delivery method is automated by the Kaltura player to ensure the best user experience.

 If you are using Access Control Profiles and are embedding a V7 player, please note that Domain Restriction is not supported with Iframe embed. This is due to the referrer which is always taken from the parent domain, and there is no access to parent domains in the Iframe element.

## Embed your playlist

When you're ready to embed the playlist, click **Copy** under the window that displays the embed code.

Embed Code

```
<iframe type="text/javascript"
src='https://cdnapisec.kaltura.com/
p/4834032/embedPlaykitJs/uiconf
_id/50952692?
iframeembed=true&entry_id=1_28
&?hvir' style="width: 560px;
```

 Copy

Select the platform you want to share your playlist to, and paste the embed code into the embed field.
