 This article is designated for all users.

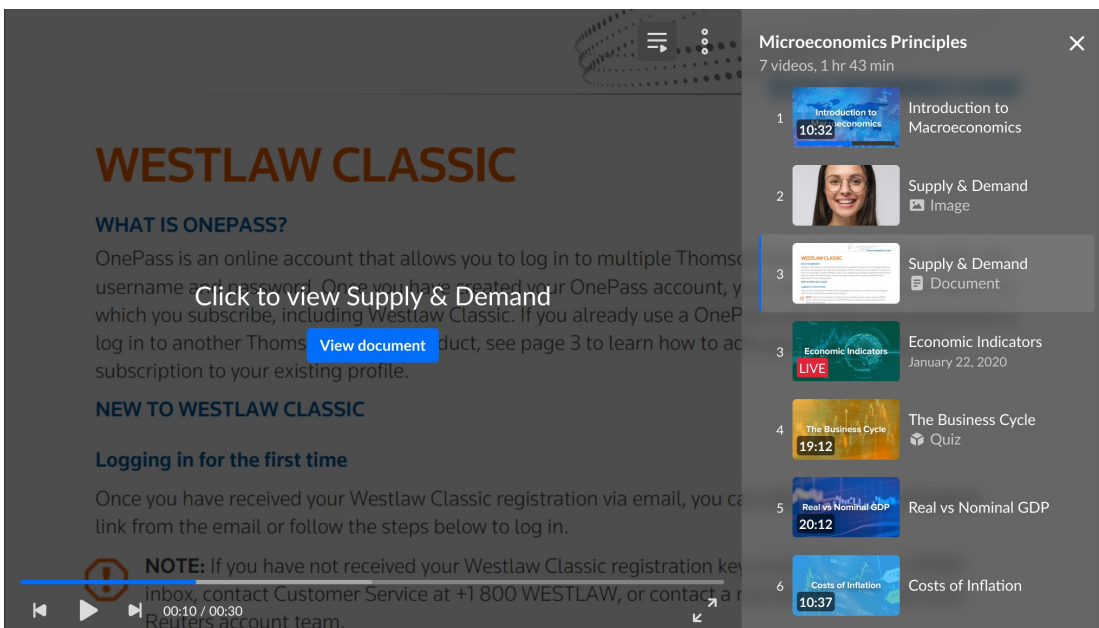

About

Kaltura's Documents plugin lets viewers access document entries included with media, such as items in a playlist.

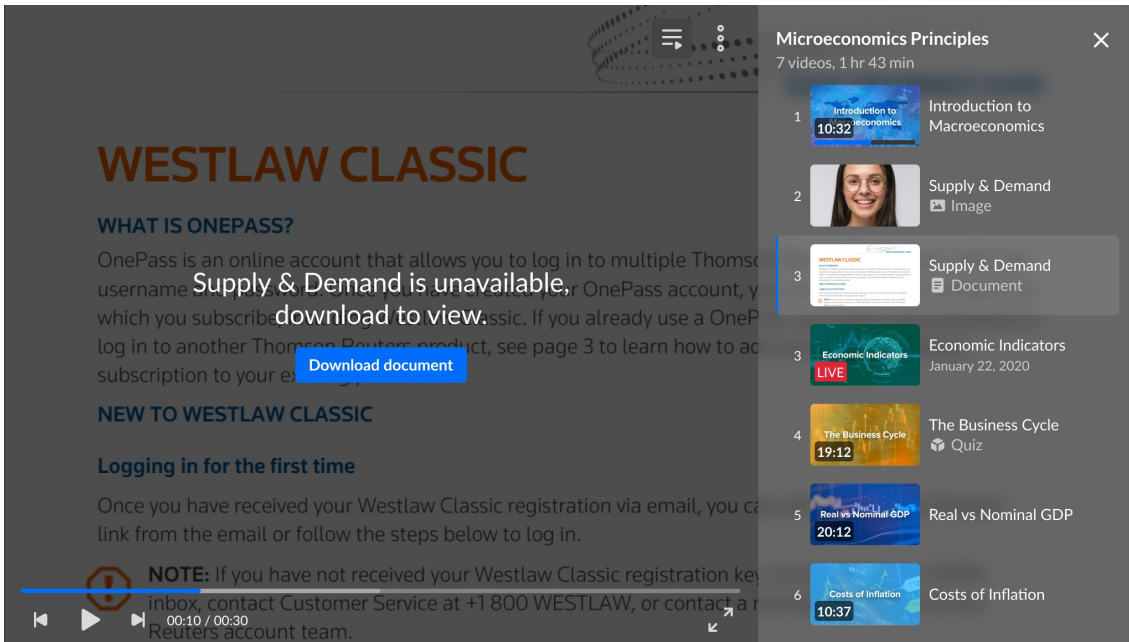

Documents are not displayed directly within the player. Instead, supported documents can be opened in a new browser tab using **View document**.

The example below shows a document entry with a thumbnail preview (the document itself isn't displayed in the player).

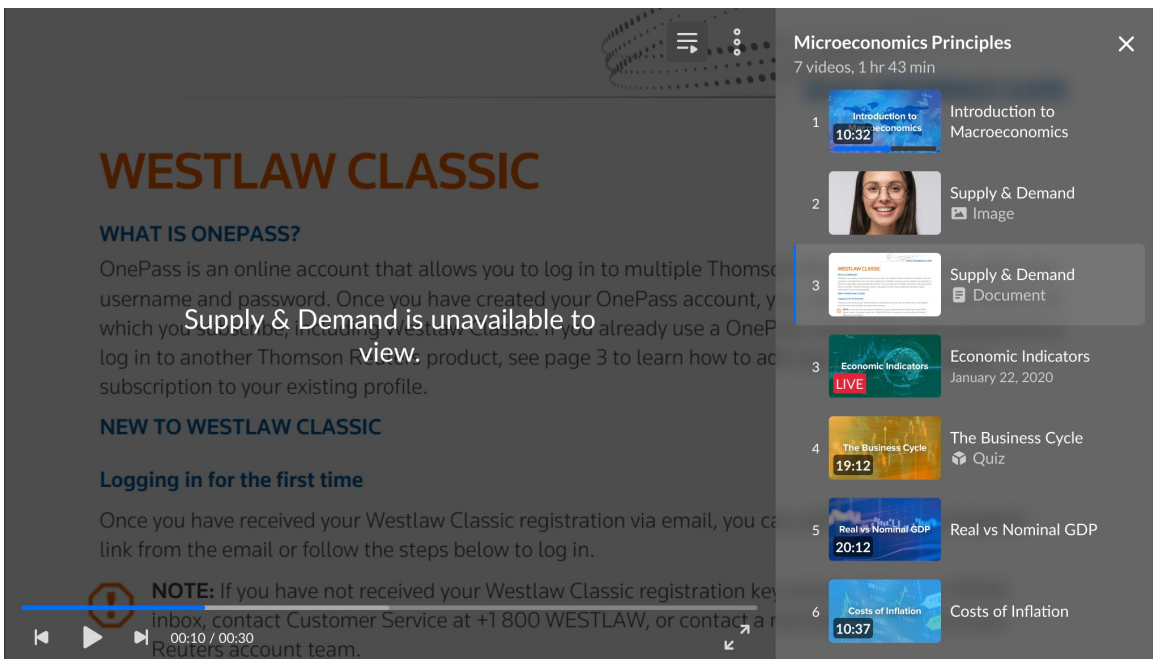

Click **View Document** to open it in a new tab.

When a document isn't available for viewing, you can download it using the **Download Document** feature, provided it's enabled on your player.

Below is a document entry that's not available for viewing, and the **Download document** feature hasn't been enabled.

Setup

To learn how to set the Documents plugin on the player, see [Enable document support on the player.](#)

Features

- Document entries can be included in playlists and are displayed with a title, icon, and thumbnail preview.

- Document download feature can be enabled to allow downloading documents when unavailable for viewing.
- Thumbnail preview of document displays on the screen in the background.

Documents are not displayed directly within the player. Supported documents open in a new browser tab.
