About

Use this article to configure an audio input.

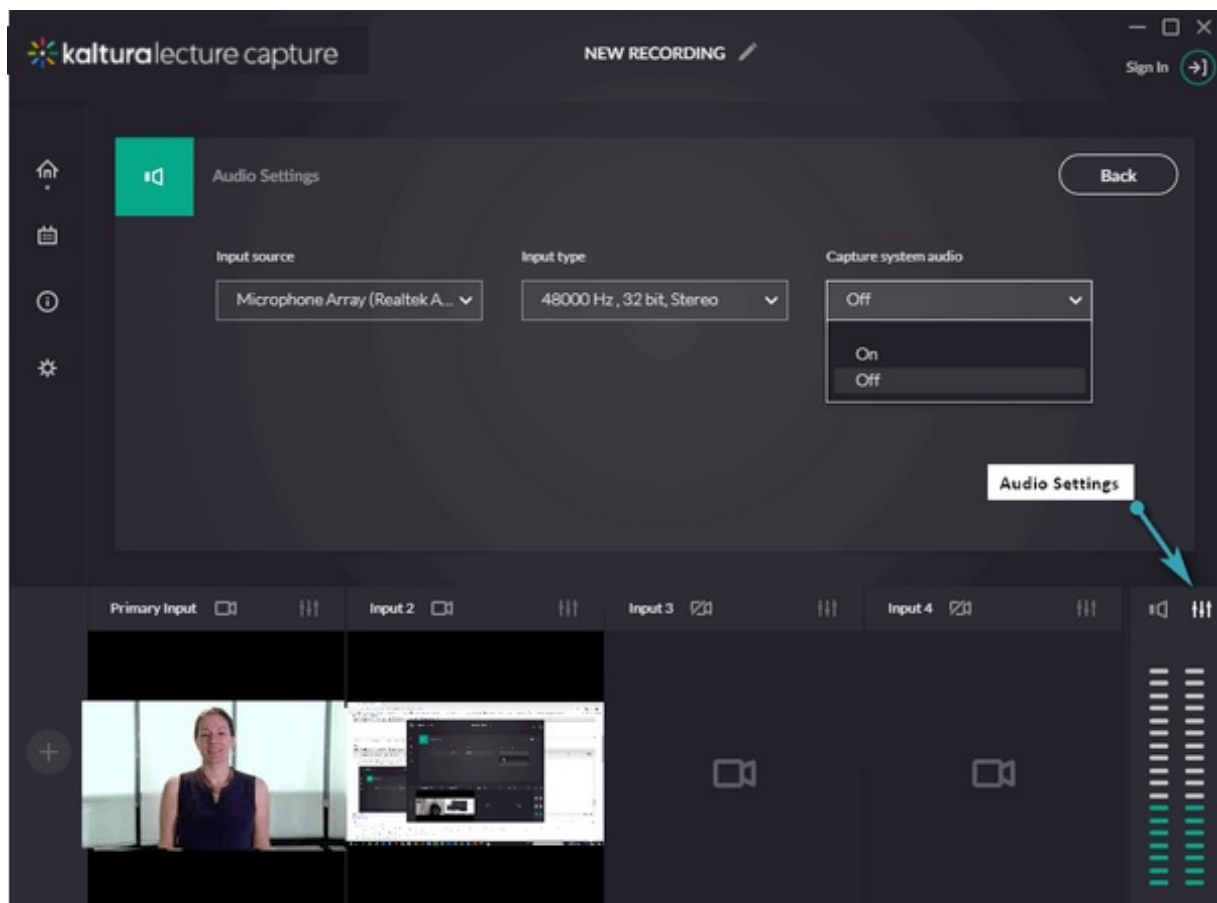

Configuring your audio settings

Audio settings are set to the highest quality available by default, so you can just start recording. If you would like to change the audio input or other audio settings, perform the following steps:

1. Click on the Audio Settings icon in the Audio section of your screen located at the right of the screen..
2. Select the Input source (microphone) and Input type you are going to record from. If there is more than one microphone connected to your PC, select the microphone you want to record.

The optimal sound settings are defined for you automatically, however, if you want to change the settings, you can change the Input Type.

3. Select On to capture the system audio. Select Off to disable the audio input.

4. Click Back to go back to the main recording window.
